

## PEFC

Reconciling an entire company with the demands of nature, design, production and logistics – that is how we understand responsibility. Our company's certification and award of the PEFC logo is symbolic of our commitment to the environment and the economic use of wood as an indispensable raw material. The integrative concept of the PEFC initiative not only strives to preserve the natural forests and their ecological balance, but also guarantees a controlled working chain that is monitored independently, totally reproducible and guaranteed to be sustainable.

## Generating heat in using waste wood

“Where wood is chopped splinters must fall“, a saying goes. This is exactly what happens in producing kitchens – where waste wood is left in abundance. What more obvious than to turn it into energy rather than leave it as waste. This way, by burning our waste wood in a thermally cleaned manner, we generate the heating energy for the entire company. This is a step towards the future, both ecologically and economically.

## Environmentally friendly on our way

From Germany to France, Spain, the UK, Benelux and other countries; anyone, like us, covering thousands upon thousands of miles across Europe bears a responsibility. To meet this responsibility, Schüller has for years been investing in an increasingly eco-friendly and fuel-saving fleet of trucks, currently numbering 55. This makes the Euro 6 standard our contribution to making the air cleaner. Today and in the future.

## Neatly packaged

We have concluded a disposal contract with a recycling management company which ensures that registered packages will substantially be processed fulfilling all requirements of the packaging ordinance. This guarantees that all packaging materials are environmentally friendly produced and disposed of.
